

Dental Implants

Dental Implants are an excellent choice to replace a single tooth or multiple missing teeth. Dental implants replicate the look and feel of your natural teeth.

Most patients are familiar with dentures. Dental Implants, however, are a newer technology and as they are nearly undetectable, may need further explanation. Dental implants are an alternative to dentures for patients who are struggling with missing teeth. Dental Implants use a titanium post to create a sturdy foundation for a crown which is matched to your natural teeth.

When compared to dentures, dental implants have a higher success rate for the replacement of missing teeth. They can provide a permanent solution to your missing teeth. Dental Implants look and feel like your natural teeth, restoring your smile and your confidence.

There are many types of Implant restorations:

- Implant placement with Implant overdenture
- Implant Bridge
- Single Implant
- Mini Implants
