FDT – Frequency Doubling Technology

We are pleased to offer a new technology in diagnosing possible diseases of the eye that a routine evaluation cannot detect. **Frequency Doubling Technology** is an exciting new way of testing visual fields (**peripheral or side vision**) of the eye. Diseases such as certain vascular and/or medication disturbances of the eye can very often be detected in early stages by this technology.

It is **strongly** recommended that all of our **patients over 30 years of age** receive this evaluation, and it is especially important for those patients who have a history of high blood pressure, diabetes, migraines, persistent headache, floaters, high prescription, or retinal problems. Additionally, if there is a family history of glaucoma, it is important to have this test periodically.

This state of the art procedure is painless, easy to administer, and takes only a few minutes of time.

If not covered by your insurance, there is an additional fee for this service.
